# Oils Populations of the Utsira High

- Are accumulations at the Paleogene level related to those in Jurassic and Triassic reservoirs on the Utsira High?
- Are there compositional variations among the two main accumulation areas in the south of Q25 and north of Q16 that inform migration and filling models?
- Do adjacent accumulations on the Gudrun and Heimdal terraces help constrain migration pathways?
- Covers all oil-bearing stratigraphic units from Paleocene to basement
- Oil-source correlations investigated
- Evaluation of alteration processes and influence of mud additives
- Comprehensive geochemical survey of >150 oils

APT is a commercial company offering high quality analyses and consultancy services to the oil industry within the fields of petroleum geochemistry, biostratigraphy and production monitoring
